## NOTES — AXIAL LEADED CHART

1. *Zener Voltage* is the key parameter for each device type. It is specified at a particular test current applied at either thermal equilibrium (T.E.) or pulse test condition. The voltage tolerance for the device types listed is, in general,  $\pm 5\%$ ; however, for some series, the voltage tolerance varies from device type to device type over a range of  $\pm (5 \text{ to } 8.5)\%$ . Consult the complete data sheet to determine the exact test conditions and minimum/maximum limits for the zener voltage. Consult Application Note AN924 regarding measurement of Zener Voltage (pulse versus thermal equilibrium).

*Power Ratings* represent the capability of the case size listed as supplied by Motorola. These ratings may be higher than the JEDEC registration and/or the same device types supplied by other manufacturers.
